MULTIPLE CARGO

INTELLIGENT EDI

COMPLETE SDK

GENERAL CARGO - RORO - CONTAINERS

"The BELLEROPHON Maritime & Logistics System is the first Enterprise Logistic Management system designed using the logistic and industrial view on how logistics in the Port Industry should be used. Most operating systems come from original container TOS systems and are modified into general cargo and bulk with warehousing modules, but they are never as robust and economical or produce the final results of this product. Port operations and vessel operations in 3D, warehousing and packing, transport and commercial, financial, equipment and human resources, invoicing and EDI are all included in the one complete system. There is no need for software engineers to create prints or reports as users can do it simply and directly inside the package saving time, but more importantly costs. A system I would recommend all general cargo/bulk & container terminals also involved in warehousing and transport to seriously consider. There is nothing comparable on the market."

- International Port Management & Terminal Operation Consultant,
JolConsultancy BV.
